

We Support PhD research

22nd June 2020

WWW supports PhD research with technical backup that doesn't compromise the intellectual property underlying database construction, thereby enabling open source analytical engagement. Our web-based services are designed to adhere to regulations of intellectual originality in dissertation research while enabling sustainability and continuing access that encourage open sourcing. The databases and websites we design, develop and host require adherence to Best Practices, the use of Controlled Vocabularies, and acceptance of standardized protocols. Our team members advise students and supervisors, in adjusting Best Practices to accommodate individual needs. Our interfaces and your data are secured on servers via our in-house developed algorithms that include up-to-date password hashing algorithms. All clients are secured to server access through two-way Secure Sockets Layer (SSL) certification. We also back up data regularly to avoid loss of information needed to complete doctoral studies. Our latest Cloudshare services allow researchers secured File Transfer Protocol (FTP) to share large size files over the world wide web.
